# R Code Implementation

-

## Variable Selection on Non-linear Manifolds

The code implements the Local Linear Selection Manifold (LLMS) and the Diagonal Auto-encoder Manifold Selection (DAMS), as presented in the PhD Thesis: *Desboulets, L. (2020). "Variable Selection on Non-linear Manifolds". AMSE Aix-Marseille University [unpublished]*. It consists in two main functions:

- `LLMS.R` - for Local Linear Manifold Selection,
- `DAMS.R` - for Diagonal Autoencoders Manifold Selection,

and two sub-functions:

- `Simulate_Manifold.R` - for simulating data on a manifold.
- `Plot_Graph.R` - for plotting the sparse graphical model.

all written in the R language. There are no dependencies for the main functions. However, `Simulate_Manifold.R` is dependent on library `MASS`, and `Plot_Graph.R` on `viridis`. The former serves for simulating multivariate normal random variables, and the latter for customized colors.

## Description

This function implements the three versions of the Local Linear Manifold Selection estimator, as well as the graphical representation. In the first case, the output is a vector of selection probabilities, of the same length as the number of variables. In the second case, the output is a matrix of selection probabilities, that represents the edges of the graph.

## Usage

```
LLMS(X, algo = "R-kNN", k = 0.2, theta = seq(0,2,length.out=100),  
m = 5, q = 0.2, batch.size = 0.2, graph.model = FALSE)
```

## Arguments

|                          |   |
|--------------------------|---|
| <code>X</code>           | The data matrix $n \times p$ , or a dataframe.  |
| <code>algo</code>        | The version of algorithm. Possible values are "vanilla", "R-kNN", "q-kNN", default is "RkNN".   |
| <code>k</code>           | The size of neighbourhoods, as a fraction of the sample size $n$ , default is 0.2.  |
| <code>theta</code>       | An increasing vector of penalties $\theta$ , default is [0,2].  |
| <code>m</code>           | Random subset size, default is 5. Only used if <code>algo</code> = "R-kNN".   |
| <code>q</code>           | Neighbourhood's neighbourhood size as a fraction of $p$ , default is 0.2. Only used if <code>algo</code> = "q-kNN".                                 |
| <code>batch.size</code>  | Size of the random batch as a fraction of the sample size $n$ . Default is 0.2. Because of replacement, it can be greater than 1.                   |
| <code>graph.model</code> | Logical flag for computing the sparse graphical model. In that case the output is a matrix representing the edges of a graph, the diagonal is zero. |

---

## Value

|       |  |
|-------|--|
| P     | LLMS estimated vector of probabilities.  |
| Paths | Selection paths.   |
| G     | 3D array of adjacency matrices, Each slice represents a sparse graphical model for a given penalty value. Only returned if <code>graph.model = TRUE</code> . |

## Examples

```
1 ## -----
2 ## Clear Memory
3 rm(list=ls())
4
5 ## -----
6 ## Load the function to simulate data and perform LLMS
7 source("Simulate_Manifold.R")
8 source("LLMS.R")
9
10 ## -----
11 ## Simulate some data
12 X <- Simulate_Manifold()
13
14 ## -----
15 ## Invoke the function
16 result <- LLMS(X)
17
18 ## -----
19 ## Plot the Selection Paths
20 matplot(result$Paths, type="l", lwd=2)
21
22 ## -----
23 ## Plot the Sparse Graphical Model
24 result <- LLMS(X, graph.model=TRUE) # Rerun the algorithm with graph.model
25 source("Plot_Graph.R")             # Customized function for plotting
26 G <- result$Graph[, , 100]         # The graph with the maximum penalty
27 Plot_Graph(G)
```

## Description

This function implements the three versions of the Diagonal Auto-Encoder Manifold Selection estimator. The output is a vector of probabilities that is the same length as number of variables in the data matrix.

## Usage

```
DAMS(X, hidden.layers = c(7,2,7), max.iter = 2e3, batch.size = 0.2,  
selection.start = 250, learning.rate = 0.05, ensemble.size = 100)
```

## Arguments

|                              |  |
|------------------------------|--|
| <code>X</code>               | The data matrix $n \times p$ .   |
| <code>hidden.layers</code>   | Vector of length $n_h$ specifying the size of each hidden layers. Default is $25 \times 5 \times 25$ . |
| <code>max.iter</code>        | Number of iterations before the learning stops. Default is 10'000.                                     |
| <code>batch.size</code>      | Size of the random batches as a fraction of the sample size $n$ . Default is 0.2.                      |
| <code>start.selection</code> | Iteration at which selection parameters start to be optimized. Default is 250.                         |
| <code>learning.rate</code>   | Normalized Learning rate controlling the speed of convergence. Default is 0.05.                        |
| <code>ensemble.size</code>   | Number of networks in the Ensemble. Default is 100.  |

## Value

|                    |  |
|--------------------|--|
| <code>P</code>     | DAMS estimated vector of probabilities (ensemble average).   |
| <code>Paths</code> | Selection paths.   |
| <code>G</code>     | 3D array of adjacency matrices, Each slice represents a sparse graphical model for a given penalty value. Only returned if <code>graph.model = TRUE</code> . |

---

## Examples

```
1 ## -----
2 ## Clear Memory
3 rm(list=ls())
4
5 ## -----
6 ## Load the functions to simulate data and perform DAMS
7 source("Simulate_Manifold.R")
8 source("DAMS.R")
9
10 ## -----
11 ## Simulate some data
12 X <- Simulate_Manifold()
13
14 ## -----
15 ## Invoke the function
16 result <- DAMS(X)
17
18 ## -----
19 ## Plot Paths
20 matplot(result$Paths, type="l", lwd=2)
21
22 ## -----
23 ## Plot the Sparse Graphical Model
24 result <- DAMS(X, graph.model=TRUE) # Rerun the algorithm with graph.model
25 source("Plot_Graph.R")             # Customized function for plotting
26 G <- result$Graph[, , 5]           # The graph with the halfway penalty
27 Plot_Graph(G)
```

---

---

*Simulate\_Manifold*

---

**Description**

This function simulates a manifold, as defined in the numerical simulations design. C.f. section 2.6.1.

**Usage**

```
Simulate_Manifold(n = 1000, p = 20, active.set = 5, r = 1, sigma = 0,  
max.corr = 0, linear = FALSE)
```

**Arguments**

|                         |   |
|-------------------------|---|
| <code>n</code>          | Number of observations.   |
| <code>p</code>          | Number of candidate variables.  |
| <code>active.set</code> | Number of active variables.   |
| <code>r</code>          | Dimension of the manifold.  |
| <code>sigma</code>      | Variance of the noise of the manifold.  |
| <code>max.corr</code>   | Maximum correlation between the noisy variables.  |
| <code>linear</code>     | Logical flag for the linearity/non-linearity of the manifold. Default is <b>FALSE</b> . |

**Value**

|                |   |
|----------------|---|
| <code>X</code> | The simulated data matrix $n \times p$ , whose <code>active.set</code> first columns lie on a <b>r</b> -manifold. |
|----------------|---|

---

---

*Plot\_Graph*

---

**Description**

This function plot a sparse graphical model from adjacency matrix **G**, provided by **LLMS()** or **DAMS()**.

**Usage**

```
Plot_Graph(G, names= NULL, title = "Sparse Graphical Model",  
  circ.size = 5, text.size = 1)
```

**Arguments**

|                  |                                       |
|------------------|---------------------------------------|
| <b>G</b>         | Adjacency matrix <b>G</b> .           |
| <b>names</b>     | Vector of names of the variables.     |
| <b>title</b>     | Title of the plot.                    |
| <b>circ.size</b> | Size of the vertices.                 |
| <b>text.size</b> | Size of the text inside the vertices. |
